Mode2

Accelerate

Rapid Discovery & Prototyping

Mode2 delivers a high-intensity onsite software development engagement, working in collaboration with your development team to build new cloud workloads in 4 weeks or less.

Sprint 0 – Discovery

Our team discovers goals and requirements using interviews and group discussions. Together, we research new innovations, capture success criteria and groom a backlog of user stories. We work jointly with your team to generate a visual design scheme for the UI and use storyboards, experience maps, and clickable HTML prototypes for UX mockups. We walk developers through technical POCs to gather data and evaluate approaches, building confidence to proceed at full-speed in the following sprints.

Sprint 1 – Prototyping

In week two, the combined team uses pair programming to build products and implement user stories from the backlog identified in Sprint 0. We provide daily internal demonstrations and discussions, gather feedback for future sprints, and evaluate progress made towards the goals.

Sprint 2 – Iterating

During week three, the project team iterates on the prototype and works towards feature-complete status for priority user stories. We review the technical products with client stakeholders and capture important feedback.

Sprint 3 – Demonstrations

For the final week, we test the prototypes and fix code bugs. Project leaders demonstrate these products to external stakeholders, and incorporate their feedback in the final deliverables.

Who is this offer for?

Teams that need to accelerate a new development project with challenging timescales.

Clients building born-in-the-cloud applications who could benefit from coaching.

Teams that want to benefit from strong software design and rapid time-to-production with Serverless.
