

Accelerate

Serverless Jumpstart

Mode2's Serverless Jumpstart is an accelerator for companies doing first Serverless projects, and need to get developers up and running quickly with environments configured to AWS best practices.

Architect & Plan

Our team reviews the project requirements and create an architecture to guide the solution. Together, we agree the software patterns required to implement the new workloads, and establish the outline plan for building the project.

Get building code!

This engagement provides everything that client development teams require to begin building fully-functioning Serverless workloads using SAM Local and/or Cloud9 IDE. We provide developer playbooks and guidelines for building applications with the new Serverless paradigm.

Releasing software and APIs

Mode2 implements a CI/CD pipeline using CodeStar tools, an enable blue-green release testing with users. We help you instrument your code for observability, review for security threats and engineer deployments for high reliability using multiple AWS regions.

Who is this offer for?

Development teams new to developing with AWS Serverless architectures.

Teams that need to assure successful development projects.
