

Develop

Redevelop an Application with Serverless

How Lean is your Team?

Did you move your company IT culture to the cloud, but have not yet not experienced the full benefits of digital transformation? Startups and cloud-first developers are building Serverless applications that require less effort than legacy applications. Have your teams seized all their opportunities to reduce technical debt and streamline operations costs?

Select an application

Clients select a single application to be redeveloped using a range of Serverless cloud solutions.

Mode2 provides the necessary architectures, UI/UX design, Serverless development, data, DevOps, and SRE engineering skills to migrate the application and transition it to the team.

Experience your benefits

This project accelerates the transition of an application to a fully Serverless architecture, enabling direct comparisons between the previous architecture and the Serverless application. The solution delivers improvements in development and deployment times, reliability, scalability, operations labor, and cloud/hosting costs.

The Process

Mode2 decomposes the application into requirements and user stories and develops the software with Serverless technologies on Amazon Web Services or Google Cloud. We work with your technical teams to finalize, test, and accept the new workloads and provide hand-over support to ensure the team is operationally ready.

Who is this offer for?

Development teams building new or reinventing existing applications

Large enterprises wanting to innovate at the speed of agile startups

Innovators and disruptors seeking a low-cost competitive edge

Contact us at [\(800\) 891-3132](tel:8008913132) or sales@mode2.com to learn how this project can transform an application and demonstrate your benefits to transform to Serverless architectures.
